Executive Summary

Deliverable D5.4.1 formalizes the Rwandan modes of social interaction documented in Deliverable D1.2: culturally sensitive behaviours, activities, actions, and motions, i.e., Rwandan cultural knowledge for polite and respectful interaction. It presents a cultural knowledge ontology and, based on this ontology, a simple representation of the cultural knowledge documented in D1.2, in the form of the cultural parameter values that can be used by the robot to emulate these polite and respectful behaviours, activities, actions, and motions.

The deliverable comprises three elements: (i) a cultural knowledge ontology, (ii) a related culture knowledge base file, and (iii) the documented software required to compile a C++ helper class to read the culture knowledge base file, store the knowledge, and make the knowledge accessible through a two public access methods.

In the work plan, this deliverable is assigned to the University of the Witswatersrand. However, the material in this version was developed and written by Carnegie Mellon University Africa. This was necessary because the ontology was needed to guide the preparation of the survey in Deliverable D1.2, and because a knowledge base was needed for integration in the system architecture described in Deliverable D3.1.

1 Introduction

Deliverable D5.4.1 formalizes the Rwandan modes of social interaction documented in Deliverable D1.2: culturally sensitive behaviours, activities, actions, and motions, i.e., Rwandan cultural knowledge for polite and respectful interaction. It presents a cultural knowledge ontology and, based on this ontology, a simple representation of the cultural knowledge documented in D1.2. This takes the form of the cultural key-value pairs that can be used by the robot to emulate polite and respectful behaviours, activities, actions, and motions.

The deliverable comprises three elements: (i) a cultural knowledge ontology, (ii) a related culture knowledge base file, and (iii) the documented software required to compile a C++ helper class to read the culture knowledge base file, store the knowledge, and make the knowledge accessible through two public access methods.

We begin in Section 2 by addressing the representation of cultural knowledge, identifying the different categories of knowledge, and we introduce a simple ontology of cultural knowledge in the form of key-value pairs. This ontology, which is shown in Fig. 2, was used to organize the questions in Part 3 of the survey described in Deliverable D1.2.

In Section 3, we map the Rwandan cultural knowledge to the knowledge ontology. To do this we first analyze the fifty-two consensus answers to the subset of the fifty-seven questions in the cultural knowledge survey documented in Deliverable D1.2, i.e., excluding questions 2-4, 2-5, 2-8, 3-28, and 3-30 for which no consensus emerged. The questions and consensus answers, reproduced from Deliverable D1.2 Rwandan Cultural Knowledge, are shown in Tables 1-4. The goal of this analysis is to map each of the fifty-two questions and consensus answers to ontology keys. This necessitated an extension to the original ontology shown in Fig. 2 to ensure that each item of knowledge has a corresponding entry in the ontology tree. This extended ontology is shown in Figs. 3 and 4.

Section 4 then lists each item of knowledge along with its corresponding key, derived from the ontology tree. It does so in two forms. First, we list keys and the corresponding items of knowledge, derived directly from the consensus answers. Second, we list keys and the corresponding items of knowledge in the form of numeric or symbolic values that can be used directly by the robot mission interpreter, i.e., the behaviorController ROS node. These key-value pairs are stored in the file that forms the culture knowledge base.

The implementation of software to support access to the culture knowledge base is described in Section 5. As noted above, this takes the form of a C++ helper class, and an example application, to read the culture knowledge base file, store the knowledge, and make the knowledge accessible through two public access methods.

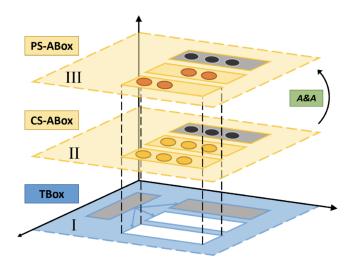

Figure 1: Knowledge representation architecture for a culturally competent robot. The bottom TBox layer (Layer I) defines the ontology for all knowledge, including domain-specific ontologies and upper ontologies that provide interoperability among domain-specific ontologies (grey boxes), and ontologies that model cultural-knowledge (white boxes). The middle CS-ABox layer (Layer II) is the culture-specific layer which includes instances of national-level cultural knowledge (yellow circles), as well as instances of knowledge from domain-specific ontologies and upper ontologies (grey circles). The top PS-ABox layer (Layer III) is the person-specific layer which includes instances of knowledge about the user (orange circles), as well as instances of knowledge from domain-specific ontologies and upper ontologies (grey circles). (From Bruno et al. 2019 [1].)

2 Representation of Cultural Knowledge

In the following, we summarize the knowledge representation architecture and knowledge classification suggested by Bruno et al. [1] and adopt elements of this classification to create a knowledge representation, i.e., a cultural knowledge ontology, that can be used in the CSSR4Africa system.

Section 3 describes the mapping of the answers to each question in the survey to the ontology, and the definition of a simple representation of the knowledge using key-value pairs, with keys derived from the ontology.

Section 4 then lists the knowledge associated with each key, and numeric or symbolic values that encapsulate this knowledge.

2.1 The Different Categories of Knowledge

Bruno et al. [1] propose a knowledge representation architecture for a culturally competent robot; see Fig. 1. This architecture has three layers, each capturing a different element of the knowledge specification. The bottom layer is a *terminological* box (TBox). This is where the ontology proper is specified. The middle and top layers are *assertional* boxes (ABox). This is where the culture-specific and person-specific knowledge (defined by the ontology) is stored.

In more detail, the three elements of the knowledge representation architecture are as follows.

A culture-generic knowledge ontology is captured in the bottom TBox layer (Layer I). This layer defines the ontology for all knowledge, including domain-specific ontologies and upper ontolo-

gies that provide interoperability among domain-specific ontologies (grey boxes), and ontologies that model cultural-knowledge (white boxes).

Culture-specific knowledge is captured in the middle CS-ABox layer (Layer II). Specifically, this layer includes instances of national-level cultural knowledge (yellow circles), as well as instances of knowledge from domain-specific ontologies and upper ontologies.

Person-specific knowledge is captured in the top PS-ABox layer (Layer III), including instances of knowledge about the user (orange circles), as well as instances of knowledge from domain-specific ontologies and upper ontologies

The culture-generic knowledge ontology captures eight types of knowledge, grouped in three categories, as follows.

- 1. Context knowledge.
 - (a) Knowledge about the assisted person.
 - (b) Knowledge about the environment.
- 2. Robot knowledge.
 - (a) Knowledge about the actions that the robot can perform.
 - (b) Knowledge about the parameters of these actions.
 - (c) Knowledge about how actions can be combined into higher-level behaviours.
- 3. Core values knowledge.
 - (a) Knowledge about the goals of the robot mission.
 - (b) Knowledge about social norms; these can be considered additional culturally-grounded goals, i.e., constraints on goals, planning operators, action, and cultural parameters.
 - (c) Knowledge about conversational subject matter.

Here, we are concerned with 2 (a) knowledge about the actions that the robot can perform, 2 (b) knowledge about the parameters of these actions, and 3 (b) knowledge about social norms. The values we use for the action and cultural parameters determine the culturally sensitive nature of the robot's actions. To quote Bruno et al. [1]:

"Knowledge pertaining to the robot's sensorimotor and communication capabilities is required by the robot to know what it can do and how the user might prefer it to be done. This knowledge again includes static, *a priori* information (e.g., describing the set of commands allowing the robot to perform the Namaste greeting, the associated parameters and their preferable values) and dynamic information (e.g., describing the robot's current posture and values of related parameters)."

These values are then used by the various ROS nodes in the CSSR4Africa system when invoking actions through ROS service requests. The values themselves are derived from the consensus answers to the survey questions.

The actions that the robot can perform — 2 (a) — depend on the functionality of the system architecture, as described in Deliverable D3.1: animate behaviour, deictic, iconic, and symbolic gesture, overt attention, locomotion and navigation. As such, we do not encode this knowledge explicitly

Date: 11/03/2025

in the CSSR4Africa knowledge base. Neither do we encode knowledge about how actions can be combined into higher-level behaviours — 2 (c) — explicitly in the CSSR4Africa knowledge base, although some of the knowledge that is revealed and made explicit by the consensus answers to the survey questions does address activities and behaviours. Thus, the cultural knowledge that is required for the CSSR4Africa project has two forms:

- 1. A compendium of culturally sensitive behaviours, activities, actions, and motions.
- 2. An knowledge ontology to categorize the behaviours, activities, actions, and motions that the Pepper robot can perform.
- 3. A mapping from the compendium of culturally sensitive behaviours, activities, actions, and motions to the ontology.
- 4. The action and cultural parameter values 2 (b) and 3 (b) that are derived from a subset of the consensus answers.

Item 1 comprises the consensus answers to the fifty-seven questions in the Rwandan cultural knowledge survey documented in Deliverable D1.2. The remaining items are documented in this deliverable. Note that the mapping from the compendium of culturally sensitive behaviours, activities, actions, and motions to the ontology is partial because there are some behaviours, activities, actions, and motions that the Pepper robot is incapable of performing.

2.2 A Knowledge Ontology for the Pepper Robot

As noted in Section 1, Deliverable D1.2 compiles the cultural knowledge required for culturally sensitive human robot interaction between robots and Rwandan people. To be effective, this knowledge must be organized in some manner. This organization is effectively a knowledge ontology that resulted from work carried out early in Task 5.4.1, and documented in this deliverable in Figure 2. This ontology was used to guide the preparation of the survey in Deliverable D1.2. As we will see in Section 3, this ontology had to be extended following an analysis of the consensus answers to the questions in the survey.

While Bruno et al. [1] use the OWL-2 language to define their ontology, we adopt a simpler approach here that represents the ontology as a tree of concepts, as shown in Figure 2. Note that the ontology is restricted to the actions that the Pepper robot can perform. It explicitly omits forms of non-verbal communication that are important in human-robot interaction, e.g., facial expressions, such as eyebrow and mouth gestures. This provides us with a straightforward way to specify the parameter values for each element in the ontology: we can represent the cultural knowledge with a simple list of key-value pairs, where a key is constructed from the name of a leaf nodes in the ontology tree and the name of its parent. The values can be either quantitative numeric values or qualitative symbolic values, which can then be interpreted by the ROS node that uses the key-value pair to produce culturally sensistive behaviour.

Date: 11/03/2025

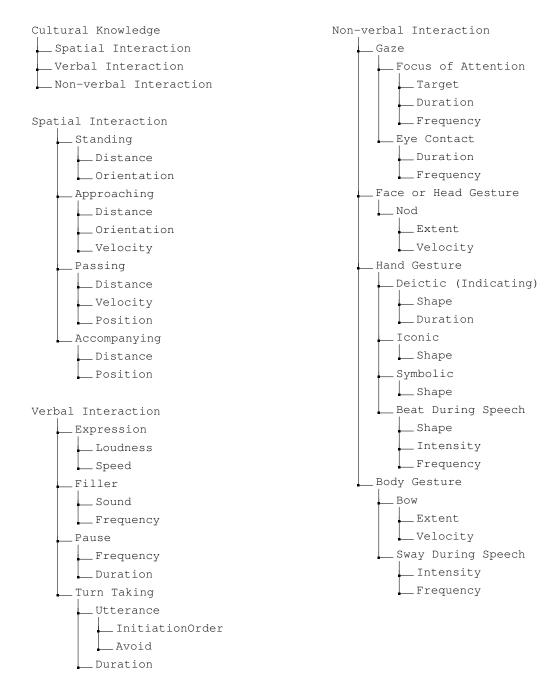

Figure 2: Original ontology of cultural knowledge. Note that the ontology is restricted to the actions that the Pepper robot can perform.

Date: 11/03/2025 Page 8

3 Mapping Rwandan Cultural Knowledge to the Knowledge Ontology Keys

By itself, an ontology is insufficient, since the knowledge base that is to be used by the robot must be populated by the knowledge that is derived from the survey and documented in Deliverable D1.2. Thus, we need to map the knowledge encapsulated in the consensus answers to each question in the survey to the ontology. For ease of reference, the survey questions and associated consensus answers in Deliverable D1.2 are reproduced here in Tables 1 – 4. Five of the fifty-seven questions in the cultural knowledge survey yielded no consensus: 2-4, 2-5, 2-8, 3-28, and 3-30, leaving fifty-two consensus answers to populate the culture knowledge base. This necessitated that the original ontology shown in Figure 2 be extended to ensure that each item of knowledge has a corresponding entry in the ontology tree. Specifically, if several survey answers map to a single leaf node in the ontology tree in Fig. 2, the ontology was extended by appending suffixes to the leaf labels, e.g., SymbolicShapeRespect instead of SymbolicShape. This results in an ontology tree with one leaf node for each consensus answer. The onology tree also has several leaf nodes for which there is no associated knowledge, either because no consensus answer emerged, or because no survey question addressed that element of the ontology. The extended ontology is shown in Figures 3 and 4.

Table 5 lists the keys derived from the original ontology tree in Figure 2, along with the questions in Parts 2 and 3 of the survey that reveal the associated cultural knowledge listed in Tables 3 and 4. Tables 6 - 8 list the keys derived from the extended ontology tree in Figures 3 and 4, along with each corresponding question in Parts 2 and 3 of the survey.

2-1	To show respect, one should lower gaze when greeting someone older.	
2-2	One should suspend work or movements and pay attention when addressed.	
2-3	One should keep intermittent eye contact; lack of eye contact depicts disrespect as it shows divided	
	attention during the interaction.	
2-4	One should not make persistent eye contact with an older person.	
2-5	One should not make eye contact when being corrected by someone.	
2-6	One should use an open palm of the hand to point to people and objects.	
2-7	One should not point an upward facing palm of the hand at someone.	
2-8	One should not use the left hand to point to anything.	
2-9	To show respect, one should bow slightly when greeting someone older.	
2-10	To show respect, one should raise both hands when greeting.	
2-11	One should not wave at someone from a distance; one should move towards them to greet them.	
2-12	One should not use the left hand to hand something to someone.	
2-13	To show respect, one should hand over and accept gifts with two hands and do so from the front,	
	facing the recipient.	
2-14	To show respect, one should shake hands with the right hand and use the left arm to support the right	
	forearm when doing so.	
2-15	An appreciation of rhythmic sound and movement is valued.	
2-16	To show respect, one should bow slightly and lower gaze when greeting someone older.	
2-17	The younger interaction partner should bow when greeting an older person or when rendering a	
	service.	
2-18	All interactions should begin with a courteous greeting.	
2-19	The younger interaction partner should enable a greeting to be initiated by an older person.	
2-20	It is respectful to use local languages and they should be used for verbal interaction when possible.	
2-21	One should use formal titles when addressing someone.	
2-22	One should engage in a preamble before getting to the point, as being too forward may be regarded	
	as disrespectful.	
2-23	One should not interrupt or talk over someone when they are speaking.	
2-24	One should not talk loudly to an older person.	
2-25	Behaviours should focus on fostering social connections and relationships; they should not be purely	
	functional.	
2-26	One should not walk between two or more people who are conversing because it is considered rude	
	to do so.	
2-27	One should not walk far ahead of an older person, unless leading the person (in which case, one	
	should walk slightly to the side).	

Table 1: Survey questions – Part 2. Respondents who took the survey were asked whether these statements were correct or incorrect, or whether they were unsure.

Date: 11/03/2025

2.1	W7. (1' (1
3-1	What distance should you keep when passing someone?
3-2	How should you acknowledge someone when passing them?
3-3	How should you pass a group of two or more people?
3-4	When showing someone older than you the way, where should you position yourself?
3-5	When showing someone the same age as you the way, where should you position yourself?
3-6	When showing someone younger than you the way, where should you position yourself?
3-7	How should you address someone who is older than you and who you haven't met before?
3-8	How should you address someone who is the same age as you and who you haven't met before?
3-9	How should you address someone who is younger than you and who you haven't met before?
3-10	Should you pause before responding when someone asks you a question? If yes, for how long?
3-11	In an interaction where you and someone else take turns to speak, would you signal that you want to speak? If yes, how do you do that?
3-12	If you are explaining something to someone, what is your primary focus of attention, i.e., where do
	you direct your gaze?
3-13	If you are explaining something to someone, how often should you make eye contact?
3-14	If you are explaining something to someone, how often would you make eye contact if the person
	was older than you?
3-15	If you are explaining something to someone, how often would you make eye contact if the person
	was younger than you?
3-16	If someone is explaining something to you, what is your primary focus of attention, i.e., where do
	you direct your gaze?
3-17	If someone is explaining something to you, how often should you make eye contact?
3-18	If someone is explaining something to you, how often would you make eye contact if the person
	was older than you?
3-19	If someone is explaining something to you, how often would you make eye contact if the person
	was younger than you?
3-20	Would you use a face or head gesture to draw someone's attention to something? If yes, what would
	that gesture be?
3-21	Would you use a face, head, hand, or body gesture to express gratitude?
3-22	Would you use a face, head, hand, or body gesture to express agreement?
3-23	Would you use a face, head, hand, or body gesture to express respect?
3-24	Would you use a face, head, hand, or body gesture to express friendliness?
3-25	Would you use a face, head, hand, or body gesture to express confusion?
3-26	Would you use a face, head, hand, or body gesture to express comprehension?
3-27	Would you use a face, head, hand, or body gesture to express interest?
3-28	Is there a face head, hand, or body gesture you should not use?
3-29	Would you use a hand or body gesture while speaking to someone?
3-30	Would you use a hand or body gesture while listening to someone?

Table 2: Survey questions – Part 3. Respondents who took the survey were given a number of possible answers from which to choose.

Question	Consensus Cultural Knowledge	
2-1	To show respect, one should lower gaze when greeting someone older.	
2-2	One should suspend work or movements and pay attention when addressed.	
2-3	One should keep intermittent eye contact; lack of eye contact depicts disrespect as it shows	
	divided attention during the interaction	
2-4	No consensus	
2-5	No consensus	
2-6	One should use an open palm of the hand to point to people and objects.	
2-7	One should not point an upward facing palm of the hand at someone.	
2-8	No consensus	
2-9	To show respect, one should bow slightly when greeting someone older.	
2-10	To show respect, one should raise both hands when greeting.	
2-11	One should not wave at someone from a distance; one should move towards them to greet them	
2-12	One should not use the left hand to hand something to someone	
2-13	To show respect, one should hand over and accept gifts with two hands and do so from the front,	
	facing the recipient	
2-14	To show respect, one should shake hands with the right hand and use the left arm to support the	
	right forearm when doing so.	
2-15	An appreciation of rhythmic sound and movement is valued.	
2-16	To show respect, one should bow slightly and lower gaze when greeting someone older	
2-17	The younger interaction partner should bow when greeting an older person or when rendering	
	a service	
2-18	All interactions should begin with a courteous greeting.	
2-19	The younger interaction partner should enable a greeting to be initiated by an older person.	
2-20	It is respectful to use local languages and they should be used for verbal interaction when possible.	
2-21	One should use formal titles when addressing someone.	
2-22	One should engage in a preamble before getting to the point, as being too forward may be	
	regarded as disrespectful.	
2-23	One should not interrupt or talk over someone when they are speaking.	
2-24	One should not talk loudly to an older person	
2-25	Behaviours should focus on fostering social connections and relationships; they should not be	
	purely functional.	
2-26	One should not walk between two or more people who are conversing because it is considered	
	rude to do so.	
2-27	One should not walk far ahead of an older person, unless leading the person (in which case, one	
	should walk slightly to the side).	

Table 3: Consensus answers to the twenty-seven questions in Part 2 of the cultural knowledge survey.

Question	Consensus Cultural Knowledge	
3-1	One should maintain a distance of one meter or less when passing someone.	
3-2	One should say 'Hello' or 'Muraho' when acknowledging someone while passing them.	
3-3	One should pass behind a group of two or more people.	
3-4	One should position themselves beside someone older when showing them the way.	
3-5	One should position themselves beside someone of the same age when showing them the way.	
3-6	One should position themselves beside someone younger when showing them the way.	
3-7	The preferred way to address someone older, and whom you haven't met before,	
	is by saying 'Muraho' or 'Hello'.	
3-8	The preferred way to address someone the same age, and whom you haven't met before,	
	is by saying 'Muraho' or 'Hello'.	
3-9	The preferred way to address someone younger, and whom you haven't met before,	
	is by saying 'Muraho' or 'Hello'.	
3-10	When asked a question, respondents should pause for a few seconds before answering.	
3-11	In turn-based conversations, participants can raise their right hand to signal their desire to speak.	
3-12	When explaining something to someone, you should direct your gaze equally between.	
	the person and the object.	
3-13	When explaining something to someone, you should make eye contact often.	
3-14	You should make eye contact often when explaining something to someone older than you.	
3-15	You should make eye contact often when explaining something to someone younger than you.	
3-16	When someone is explaining something to you, you should direct your gaze equally	
	between the person and the object.	
3-17	When someone is explaining something to you, you should make eye contact often.	
3-18	If someone is explaining something to you and they are older than you, you should make	
	eye contact often.	
3-19	If someone is explaining something to you and they are younger than you, you should make	
	eye contact often.	
3-20	To draw someone's attention to something, use a head-nodding gesture while looking	
	at the object.	
3-21	To express gratitude, common gestures include nodding, smiling, and bowing the head,	
	using hand gestures like a thumbs up or clasped hands, and slight bowing of the body.	
3-22	To express agreement, common gestures include nodding the head and giving a thumbs up	
	with the right hand.	
3-23	To show respect, common gestures include a slight bow of the head, a greeting or handshake	
	using the right hand supported by the left, and bowing, which is the most frequent body gesture.	
3-24	To express friendliness, people commonly use facial gestures like smiling, hand gestures	
	such as a handshake using both hands or the right hand, and body gestures such as hugging.	
3-25	When expressing confusion, individuals typically use facial gestures like wrinkling or frowning	
	the brow or tilting the head, hand gestures such as raising both hands or the right hand,	
	tand body movements that vary according to the situation.	
3-26	When expressing comprehension, individuals typically use head gestures, such as nodding,	
	hand gestures like a right-hand thumbs-up, and body gestures that vary by situation.	
3-27	When expressing interest, nodding and smiling are the most common gestures.	
	Hand gestures, such as giving a thumbs up with the right hand, and body gestures such as	
	facing someone, are used less frequently.	
3-28	No consensus.	
3-29	One should use various body and hand gestures while speaking to someone.	
	The most recommended gestures are slight body movement and slightly moving both hands.	
3-30	No consensus.	
3-30	No consensus.

4 Culture Knowledge Base

Tables 9–11 lists the knowledge associated with each key in the extended ontology tree: spatial interaction, verbal interaction, and non-verbal interaction. Tables 12 –14 list the key-value pairs, i.e., with numeric or symbolic values that encapsulate the cultural knowledge. These numeric or symbolic values can then be used directly in the robot mission interpreter, i.e., the behaviorController ROS node, and passed as arguments in the service requests it issues to the nodes in the system architecture to achieve culturally sensitive behavior.

The key-value pairs are stored in a file <code>cultureKnowledgeBaseInput.dat</code>. This file is read and the value-pairs are accessed using a helper class <code>CultureKnowledgeBase</code> described in Section 5.

Spatial Interaction

5 Implementation

The key-value pairs listed in Tables 12 –14, comprising an alphanumeric key and associated numeric or symbolic values that encapsulate the cultural knowledge, are stored in a file named <code>cultureKnowledgeBaseInput.dat</code>. This file is accessed using a C++ helper class <code>CultureKnowledgeBase</code> described in this section. Specifically, a C++ object instantiation of the helper class reads the culture knowledge base file, store the knowledge, and make the knowledge accessible through two public access methods. The remainder of this section details the implementation of this C++ helper class.

5.1 File Organization

Since the C++ helper class is intended to be embedded in behaviorController ROS node, it is not included as an individual component in the GitHub software repository. That said, the constituent files are organized is several subdirectories in a utilities package, as shown in Figure 5.

There are three C++ source code files: cultureKnowledgeBaseApplication.cpp, cultureKnowledgeBaseImplementation.cpp, and cultureKnowledge.h. The implementation file contains the helper class definition. The interface file contains the helper class declaration.

The application file is essentially a unit test to illustrate how the helper class is used and to verify that it works correctly. It instantiates a C++ helper class object which reads the culture knowledge base file, and uses the access method to retrieve values in the culture knowledge base, implemented using a binary search tree dictionary data structure, write them to the terminal.

It is intended that the implementation and interface files, along with the configuration and data files, be integrated in the behaviorController ROS node files. The relevant parts of the behaviorController software can use the application code as the basis of its implementation of functionality to access the knowledge base.

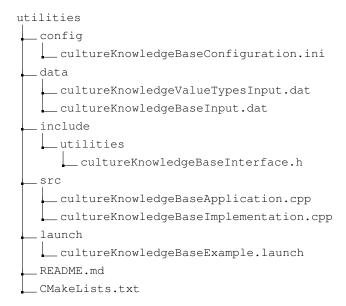

Figure 5: Directory Structure for the CultureKnowledgeBase C++ helper class.

5.2 Configuration File

The population of the knowledge base is determined by the contents of a configuration file cultureKnowledgeBase.ini that contain a list of key-value pairs, as shown below in Table 15.

The configuration file is named culture Knowledge Base Configuration.ini.

Table 15: Configuration file for the CultureKnowledgeBase helper class.

Key	Value	Description
valueTypes	cultureKnowledgeValueTypesInput.dat	Specifies the filename of the file in which the type of the values in each cultural knowledge key-value pair is specified.
knowledgeBase	cultureKnowledgeBaseInput.dat	Specifies the filename of the file in which the cultural knowledge key-value pairs are stored.
verboseMode	true or false	Specifies whether diagnostic data is to be printed to the terminal.

5.3 Culture Knowledge Value Types

The types of each value are listed in Tables 16 and 17. There are four types, one to represent an integer value, one to represent a single word, and one to represent a multi-word string. Key-value pairs without values in Tables 12 -14 have been assigned a fourth value type of UNDEFINED. The types are represented with a numeric value, as follows.

```
#define UNDEFINED 0
#define NUMBER 1 // integer type
#define WORD 2 // single word
#define PHRASE 3 // multi-word phrase
```

5.5 Output Data File

There is no output data file for the culture knowledge base helper class.

5.6 Class Definition

Instantiating the CultureKnowledgeBase class as a C++ object causes the contents of the culture knowledge base file to be read and stored in private dictionary data structure. Diagnostic messages are printed on the screen, depending on the value of verboseMode key in the configuration file. The contents of the dictionary are accessed using the keys. Appendix A provides the full definition of the CultureKnowledgeBase class.

5.6.1 Constructor

The CultureKnowledgeBase() constructor reads the configuration file to determine the mode of operation, the name of the knowledge base value types file, and the name of the knowledge base file. It sets a private data member flag with the mode of operation, initializes the private dictionary data structure with the key-value pairs read from the knowledge base file. If operating in verbose mode, it echoes the keys and values to the terminal.

5.6.2 Destructor

The ~CultureKnowledgeBase() destructor deletes the dictionary data structure and write a diagnostic message if in verbose mode.

5.6.3 Private Data

The dictionary is implemented using a binary search tree with an element of type struct KeyValueType, with four fields.

```
typedef struct {
   char *key;
   union {
      int integerValue;
      char* alphanumericValue;
   };
   int valueType;
   bool initialized;
} KeyValueType;
```

The first field is the key. The data type is a C-string, i.e., a null-terminated array of characters.

The second field is the value associated with each key. The data type is dependent of the key: either an integer or a C-string, with the values specified in Tables 12 -14. This is accommodated by using a union data type, with two fields integerValue and alphanumericValue, an integer and a C-string respectively, the latter implemented as a null-terminated array of characters.

The is also an integer flag valueType to denote the type of the value so that it can be processed correctly, i.e., so that one knows which element of the union has been used for that key. It has one of four values — NUMBER, WORD, PHRASE, and UNDEFINED — as noted above.

Finally, there is a Boolean flag initialized that is set to true if the key has been initialized with a valid value. This flag is set to false if the value type of the key is UNDEFINED.

There are also a small number of other private utility data fields to store the configuration filename, the configuration data, a keyValue, and the verbose mode flag.

Date: 11/03/2025 Page 31 Version: No 1.5

5.6.4 Public Access Methods

There are two public methods, one to print the knowledge base to the screen and one to retrieve a key-value pair. These are printToScreen() and getValue(), respectively.

The printToScreen() method does not have any parameters.

The getValue() method has two parameters: a key and a value, as follows.

bool getValue(char *key, KeyValueType *keyValue);

The method returns true if the key value was successfully retrieved from the dictionary, false otherwise.

Date: 11/03/2025
Version: No. 1.5

6 Example Application

The example application in cultureKnowledgeBaseApplication.cpp illustrates the use of the class to read the culture knowledge base file and print each key-value pair, along with its value type and initialization flag. It also provides four examples of how to retrieve the values of keys, each one with a different value type, and write the associated values to the terminal.

```
#include <utilities/cultureKnowledgeBase.h>
int main() {
  KeyValueType keyValue; // structure with key, value, value type, initialization flag Keyword key; // string int i; // counter
   /* instantiate the cultural knowledge base object
   /st this reads the knowledge value types file and the knowledge base file st/
   /* as specified in the culturalKnowledgeBaseConfiguration.ini file
   CultureKnowledgeBase knowledgebase:
   /* verify that the knowledge base was read correctly */
  knowledgebase.print to screen();
   /* guery the contents off the knowledge base */
   /* retrieve example of the four value types
  for (i=0; i<4; i++) {
   switch (i) {
        case UNDEFINED: strcpy(key, "ExpressionSpeed");
                          break:
         case NUMBER:
                          strcpy(key, "PassingDistance");
        case WORD: strcpy break;
                          strcpy(key, "PassingPositionAvoid");
                   SE: strcpy(key, "PhrasePreambleEnglish"); break;
         case PHRASE:
      if (knowledgebase.getValue(key, &keyValue) == true) {
         switch (keyValue.valueType) {
            case UNDEFINED: printf("main: attempting to retrieve an UNDEFINED value type\n");
                             break:
            case NUMBER: printf("main: %-40s %-40d %-20s %-20s\n", keyValue.key,
                                                keyValue.integerValue,
                                                valueType2Alphanumeric(keyValue.valueType),
                                               initialized2Alphanumeric(keyValue.initialized));
                             break:
            case WORD:
                            printf("main: %-40s %-40s %-20s %-20s\n", keyValue.key,
                                              keyValue.alphanumericValue,
valueType2Alphanumeric(keyValue.valueType),
                                                initialized2Alphanumeric(keyValue.initialized));
                             printf("main: %-40s %-40s %-20s %-20s\n", keyValue.key,
            case PHRASE:
                                              keyValue.alphanumericValue,
                                               valueType2Alphanumeric(keyValue.valueType).
                                                initialized2Alphanumeric(keyValue.initialized));
                             break;
                             printf("main: invalid value type %d\n", keyValue.valueType);
            default:
                             break;
      else (
          printf("main: invalid key %s\n", key);
```

Note the use of two utility functions, valueType2Alphanumeric and initialized2Alphanumeric, which convert the integer value type valueType and the Boolean initialized value to their equivalent alphanumeric strings for ease of interpretation when reporting them on screen. Run the application by entering the following command:

```
rosrun utilities cultureKnowledgeBaseExample
```

This assumes the existence of a utilities package, as shown in Figure 5, and that the package has been built with catkin_make. A screenshot of the output of running this application is shown in Figure 6.

Principal Contributors

The main authors of this deliverable are as follows (in alphabetical order).

Eyerusalem Birhan, Carnegie Mellon University Africa. Muhirwa Richard, Carnegie Mellon University Africa. David Vernon, Carnegie Mellon University Africa.

Date: 11/03/2025 Page 37

Document History

Version 1.0

First version created by moving and reorganizing Section 2 Representation of Cultural Knowledge and Section 3.2 Action and Cultural Parameter Values from Deliverable D1.2.

David Vernon.

30 December 2024.

Version 1.1

Changed ontology category from Words to Expression.

Introduced an extended ontology tree in which there is at least one leaf node for each consensus answer; see Fig. 3.

Added Tables 6 - 14.

Added Section 5 Implementation.

David Vernon.

25 February 2025.

Version 1.2

Added launch subdirectory and launch file to the directory structure in Figure 5.

David Vernon.

28 February 2025.

Version 1.3

Changed cultureKnowledgeBase.dat and cultureKnowledgeBaseValueTypes.dat to cultureKnowledgeBaseInput.dat and cultureKnowledgeBaseInput.dat to be compliant with the software engineering standards.

David Vernon.

3 March 2025.

Version 1.4

Changed cultureKnowledgeBase.dat and cultureKnowledgeBaseValueTypes.dat to cultureKnowledgeBaseInput.dat and cultureKnowledgeBaseInput.dat to be compliant with the software engineering standards.

David Vernon.

3 March 2025.

Version 1.5

Removed the utilities sub-directory since the C++ helper classes will be integrated directly in the software for the behaviorController node and not be made available independently. Extended the ontology and added new keys to allow for phrases and utterances in English, isiZulu, and Kinyarwanda.

David Vernon.

11 March 2025.
